EDUCATION & IT TRAINING

Software Development / IT Training | Star Computer Systems Limited (IsDB IT Scholarship) | 2026

- **Focus Areas:** Software Design, Relational Databases, Backend Systems Engineering, RESTful APIs, Web Development.
- **Relevant Technologies:** C#/.NET, JavaScript, Microsoft SQL Server, MongoDB.

TECHNICAL SKILLS

- **Languages:** C#, JavaScript, SQL, HTML5, CSS3, XML
- **Core Technologies:** ASP.NET Core, ASP.NET Web API, Entity Framework Core, Node.js, Express.js, Angular
- **Databases & Systems:** Microsoft SQL Server, MongoDB, Relational Database Design, Data Modeling
- **Tools & Concepts:** Git/GitHub, Postman, REST APIs, Token-based Authentication, Object-Oriented Programming

SOFTWARE ENGINEERING PROJECTS

Supply Chain Web API (Backend System Design) | C#, ASP.NET Core, Entity Framework Core, SQL Server

- Engineered a RESTful backend API capable of managing master-detail data structures, by implementing comprehensive CRUD controllers and routing in ASP.NET Core.
- Architected a secure relational database schema accommodating diverse data types (text, boolean, dates, images), by designing normalized entity relationships in SQL Server.
- Secured system endpoints against unauthorized access to ensure data privacy, by integrating and validating robust token-based authentication protocols via Postman.

E-Commerce Web Application (Full-Stack Development) | JavaScript, Node.js, Express.js, MongoDB, WebSockets

- Developed a scalable full-stack e-commerce platform facilitating end-to-end shopping workflows, by utilizing Node.js, Express.js, and a MongoDB backend.
- Implemented a comprehensive order processing pipeline supporting cash-on-delivery and address tracking, by engineering dynamic backend logic and conceptual email verification.
- Designed interactive UI components delivering dynamic data updates, by integrating WebSocket-related functionality with client-side JavaScript and jQuery.

Power Plant Generation Database (Data Architecture) | Microsoft SQL Server, SQL, Data Modeling

- Designed a highly normalized relational database schema managing monthly power generation metrics across a fiscal year, by modeling complex real-world industrial specifications.
- Structured unorganized operational spreadsheet data into reliable, queryable relational tables, by developing data transformation and normalization pipelines using SQL.
- Demonstrated data engineering capabilities by establishing core operational entities (PowerPlant, FuelType, TimePeriod) to ensure data integrity and scalable retrieval.
